The present invention relates to a semiconductor device, and more particularly to a semiconductor device having a LOCOS oxide film. In a semiconductor device having a large-sized circuit, it is very important to reduce the size of the device. Therefore, in a semiconductor memory device such as a DRAM, an attempt has been made to reduce the size of memory cells. In the DRAM, since the memory cells must have a high level of integration density, the formation of a field oxide film, which defines an active region, is performed after the gate electrodes are formed by a general patterning process. The DRAM is a storage type semiconductor device which stores data in memory cells each consisting of one capacitor and one MOS transistor. In the DRAM, the memory cell is constituted by one transistor and one capacitor. The storage capacitance of the capacitor must have a sufficient amount to store the amount of electric charge needed to maintain data. Therefore, the capacitor must have a sufficient area. If the storage capacitance is designed to be large, however, the size of the memory cell must be increased. In order to solve this problem, an attempt has been made to increase the degree of integration of the device by increasing the area of the capacitor. For this purpose, the aspect ratio of the capacitor is increased, the storage capacity is reduced, or the distance between adjacent memory cells is reduced. If the storage capacitance is decreased or the distance between adjacent memory cells is reduced, the integration density of the device is decreased. In order to realize a storage capacitance of a sufficient amount, a three-dimensional structure is formed. The DRAM includes a storage electrode of a fin shape, and a storage dielectric film is formed in the fin shape to cover the storage electrode. In this structure, however, if the fin size is increased, a storage capacitance of a sufficient amount cannot be obtained. In order to overcome this problem, in some DRAMs, a method of increasing the area of a lower electrode

The same is true for Windows PCs, except you’d use Microsoft’s Media Player. Windows users have Microsoft’s Media Player built-in. Apple users don’t have iTunes. Windows users have Microsoft’s Windows Media Player built-in. Apple users don’t have iTunes. Not many people use Media Player for this purpose. But there are a few exceptions. One of those is music player, Magic Fingers, which makes a terrific stand-alone app for copying music to a Windows PC. Magic Fingers is specifically designed to copy MP3 files to your PC. But it doesn’t force you to have iTunes on your computer. So, you can use Magic Fingers to transfer music from an iPod or iPhone to your PC, without having iTunes. And you can convert songs to the iTunes format, without having iTunes. Magic Fingers doesn’t come with a converter. But there are a couple of open-source converters you can download for free. Both of them are very easy to use. The first converter is ID3 Toolkit, an open-source tool, which can be used to convert MP3 to iTunes, as well as other popular music formats. This converter is easy to use, and you don’t have to install any additional software to use it. ID3 Toolkit doesn’t come with a converter. But, there are a couple of other free converters, including MP3 Converter Plus, ID3 Toolkit Lite, and Easy Music Converter.
